

AMENDMENTS TO ABSTRACT

~~The present invention provides an~~ An optical fiber connector to be connected to a printed circuit board[.]. ~~The optical fiber connector~~ comprises a main body and a supporting bracket. The main body has an ~~inserted~~ insertion surface and a ~~joined~~ joining surface arranged opposite to each other, the ~~inserted~~ insertion surface ~~comprises including~~ a fiber groove, and the ~~joined~~ joining surface ~~is faced with~~ facing the printed circuit board. One end of the side surface connects to said top surface and the other end of the side surface extends to form a connecting piece. ~~Thus, the~~ The connecting piece is fastened into the printed circuit board to form a ~~180-~~ 180 degree angled optical fiber connector. The optical fiber transmitting lines can be perpendicularly inserted into the optical fiber connector[.]. ~~It also economizes thereby reducing~~ the molding cost and manufacturing time.
